AB Cone snails use venom conly, a cocktail of peptides (conopeptides) to capture their prey. Many of these peptides also target mammalian receptors, often with exquisite selectivity. Here we report the discovery of two new classes of conopeptides. One class targets α 1A α 1-adrenoceptors (p-TIA from the fish-hunting *Conus tulipa*), and the second class targets the neuronal noradrenaline transporter (chi-Mrta and chi-MrtaB from the mollusk-hunting *C. marmoreus*). rto-Mrta and chi-Mrta selectively modulate these important membrane-bound proteins. Both peptides act as reversible non-competitive inhibitors and provide alternative avenues for the identification of inhibitor drugs.

TI λ mbrda-Conotoxins, a new family of conotoxins with unique disulfide pattern and protein folding: isolation and characterization from the venom of *Conus marmoreus*

AB Conotoxins are multiple disulfide-bonded peptides isolated from marine cone snail venom. These toxins have been classed into several families based on their disulfide pattern and biol. properties. Here, the authors report a new family of *Conus* peptides, which have a novel cysteine motif. Three peptides of this family (CMaVIA, CMaVIB, and CMaX) have been purified from *Conus marmoreus* venom, and their structures have been deid. Their amino acid sequences are VCCGYKLCHOC (CMaVIA), NGVCCGYKLCHOC (CMaVIB), and GICCGVSFCYOC (CMaX), where O represents 4-trans-hydroxyproline. Two of these peptides (CMaVIA and CMaX) have been chem. synthesized. Using a selective protection and deprotection strategy during disulfide bond formation, peptides with both feasible cysteine-pairing combinations were generated. The disulfide pattern (C1-C4, C2-C3) in native toxins was identified by their co-elution with the synthetic disulfide-isomeric peptides on reverse-phase HPLC. Although cysteine residues were found in comparable positions with those of α 1A-conotoxins, these toxins exhibited a distinctly different disulfide bonding pattern; the authors have named this new family " λ mbrda-conotoxins." CMaVIA and CMaX induced different biol. effects when injected intra-cerebroventricularly in mice: CMaVIA induces seizures, whereas CMaX induces flaccid paralysis. The synthetic peptide with λ mbrda-conotoxin folding is about 1150-fold more potent in inducing seizures than the mispaired isomer with α 1A-conotoxin folding. Thus it appears that the unique disulfide pattern, and hence the "ribbon" conformation, in λ mbrda-conotoxins is important for their biol. activity. AB Cone snails are tropical marine mollusks that venomate prey with a complex mixt. of neuropharmacol. active compds. The authors report the discovery and biochem. characterization of a structurally unique peptide isolated from the venom of *Conus marmoreus*. The new peptide, mr10a, potently increased withdrawal latency in a hot plate assay (a test of analgesia) at intrathecal doses that do not produce motor impairment as measured by rotarod test. The sequence of mr10a is NGVCCGYKLCHOC, where O is 4-trans-hydroxyproline. This sequence is highly divergent from all other known conotoxins. Anal. of a cDNA clone encoding the toxin, however, indicates that it is a member of the recently described T-superfamily. Total chem. synthesis of the three possible disulfide arrangements of mr10a was achieved, and elution studies indicate that the native form has a disulfide connectivity of Cys1-Cys4 and Cys2-Cys3. This disulfide linkage is unprecedented among conotoxins and defines a new family of *Conus* peptides. AB The invention relates to relatively short peptides (termed ap-conotoxins herein), about 10-20 residues in length, which are naturally available in minute ams. in the venom of cone snails or analogous to the naturally available peptides, and which preferably include two disulfide bonds. These conotoxin peptides have analgesic activity and are thus useful for treating or preventing pain. Thus, the cDNA encoding the Conus marmoreus Marl1 propeptide was cloned and the analgesic activity of Marl1 and Marl2 was demonstrated in mice. AB The higher plant *Arabidopsis thaliana* is an important model for identifying plant genes and deq. their function. To assist biol. investigations and to define chromosome structure, a coordinated effort to sequence the *Arabidopsis* genome was initiated in late 1996. This report describes one of the first milestones of this project, the sequence of chromosome 4. Anal. of 17.38 megabases of unique sequence, representing about 17% of the genome, reveals 3744 protein coding genes, 81 rRNAs, and numerous repeat elements. Heterochromatic regions surrounding the putative centromere, which has not yet been completely sequenced, are characterized by an increased frequency of a variety of repeats, new repeats, reduced recombination, lowered gene d., and lowered gene expression. Roughly 60% of the predicted protein-coding genes have been functionally characterized on the basis of their homol. to known genes. Many genes encode predicted proteins that are homologous to human and *Caenorhabditis elegans* proteins. AB The complete sequence of the genome of an aerobic hyper-thermophilic crenarchaeon, *Aeropyrum pernix* K1, which optimally grows at 95 degree., was dectd. by the whole genome shotgun method with some modifications. The entire length of the genome was 1,669,695 bp. The authenticity of the entire sequence was supported by restriction anal. of long PCR products, which were directly amplified from the genomic DNA. As the potential protein-coding regions, a total of 2694 open reading frames (ORFs) were assigned. By similarity search against public databases, 633 (23.5%) of the ORFs were related to genes with putative function and 523 (19.4%) to the sequences registered but with unknown function. All the genes in the TCA cycle except for that of alpha-ketoglutarate dehydrogenase were included, and instead of the alpha-ketoglutarate dehydrogenase gene, the genes coding for the 2 subunits of 2-oxoacid:ferredoxin oxidoreductase were identified. The remaining 1538 ORFs (37.1%) did not show any significant similarity to the sequences in the databases. Sequence comparison among the assigned ORFs suggested that a considerable member of ORFs were generated by sequence duplication. The RNA genes identified were a single 16S-23S rRNA operon, two 5S rRNA genes, and 47 rRNA genes including 14 genes with intron structures. All the assigned ORFs and RNA coding regions occupied 89.12% of the whole genome. The data presented in this paper are available on the internet homepage (<http://www.nitd.nite.go.jp>) RE CNT 23 THERE ARE 23 CITED REFERENCES AVAILABLE FOR THIS RECORD ALL CITATIONS AVAILABLE IN THE RE FORMAT

AB The present invention relates to 125 novel human secreted proteins and isolated nucleic acids contg. the coding regions of the genes encoding such proteins. Tissue distribution, sequence homologies, and preferred epitope sites are provided for the secreted proteins, as well as chromosomal mapping of some of the genes. Also provided are vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins in bacterial, insect, and mammalian cells. The invention further relates to diagnostic and therapeutic methods useful for diagnosing and treating disorders related to these novel human secreted proteins. High-throughput screening assays are also provided for various putative activities of the secreted proteins. T1 The complete nucleotide sequence and functional organization of *Bacillus subtilis* bacteriophage SPP1

AU Alonso, Juan C.; Luder, Gerhild; Stiege, Asila C.; Chai, Sunghae; Weise, Frank; Trautner, Thomas A.

CS Centro Nacional Biotecnologia, CSIC, Campus Universidad Autonoma Madrid, Madrid, 28049 Spain

SO Gene (1997), 204(1/2), 201-212 CODEN: GENED6; ISSN: 0378-1119 PB Elsevier Science B.V. DT Journal LA English

AB The complete nucleotide sequence of the B. subtilis bacteriophage SPP1 is described. The genome is 44 007 bp in size and has a base compn. of 43.7% dG+dC. Only 32.2 kb are essential for phage amplification under lab. conditions. Transcription using only the 'heavy strand' is asym. Eight-one orfs organized in five early and four late operons were identified. Expts. have shown that 25 orfs are essential. Of the remaining orfs, functions could be predicted for the products of five of the orfs on the basis of comparison of the deduced amino acid sequence to known proteins. Intergenic regions include most of the 5' P1 and the 4' P1 promoters. Transcripts are polycistronic. Transcription from the P1 promoters is mediated by host RP, whereas recognition of the P1 promoters requires an addnl. unidentified phage-encoded product. Translation of mRNA transcribed from most of the orfs seems to be initiated independently, each from its own ribosomal binding and initiation site, although a few cases of coupled translation have been reported. The organization of SPP1 genes involved in the replication, DNA packaging and phage assembly proteins resembles the organization of genes of equiv. regions of different E. coli double-stranded DNA phages. Absence of aa sequence similarity between analogous proteins of different phages suggested that the conserved gene organization is representative of a primordial bacteriophage. TI Vasotocin genes of the teleost fish *Catostomus commersoni*: gene structure, exon-intron boundary, and hormone precursor organization

AU Morley, Steven D.; Schoenrock, Christiane; Heierhorst, Joerg; Figueroa, Jaime; Lederfs, Karl; Richter, Dietmar

CS Inst Zellbiochem., Univ. Hamburg, Hamburg, 2000/20, Fed. Rep. Ger.

SO Biochemistry (1990), 29(10), 2506-11 CODEN: BICHAW; ISSN: 0006-2960 DT Journal LA English

AB Some cDNA clones encoding 2 members of the vasotocin hormone precursor gene family were isolated from the white sucker *C. commersoni*. The hormone is encoded by 2 distinct genes, both of which are expressed, as indicated by Northern blot anal. Genomic DNA amplified by the polymerase chain reaction has been used to define exon-intron boundaries. Both vasotocin genes contain introns in positions corresponding to those found in the gene of their mammalian counterpart vasopressin. The predicted vasotocin precursors show a surprising degree of sequence divergence, amounting to 45% at the amino acid level, of which only approx. 1/2 can be accounted for by conservative amino acid changes. The precursors include a

hormone moiety, followed by a putative neurophysin sequence, that is longer at the C-terminus by a tract of some 30 amino acids by comparison to their mammalian counterpart. Each of these sequences contains a leucine-rich core segment resembling that found in copeptin, a glycopeptide moiety present in mammalian vasopressin precursors.
